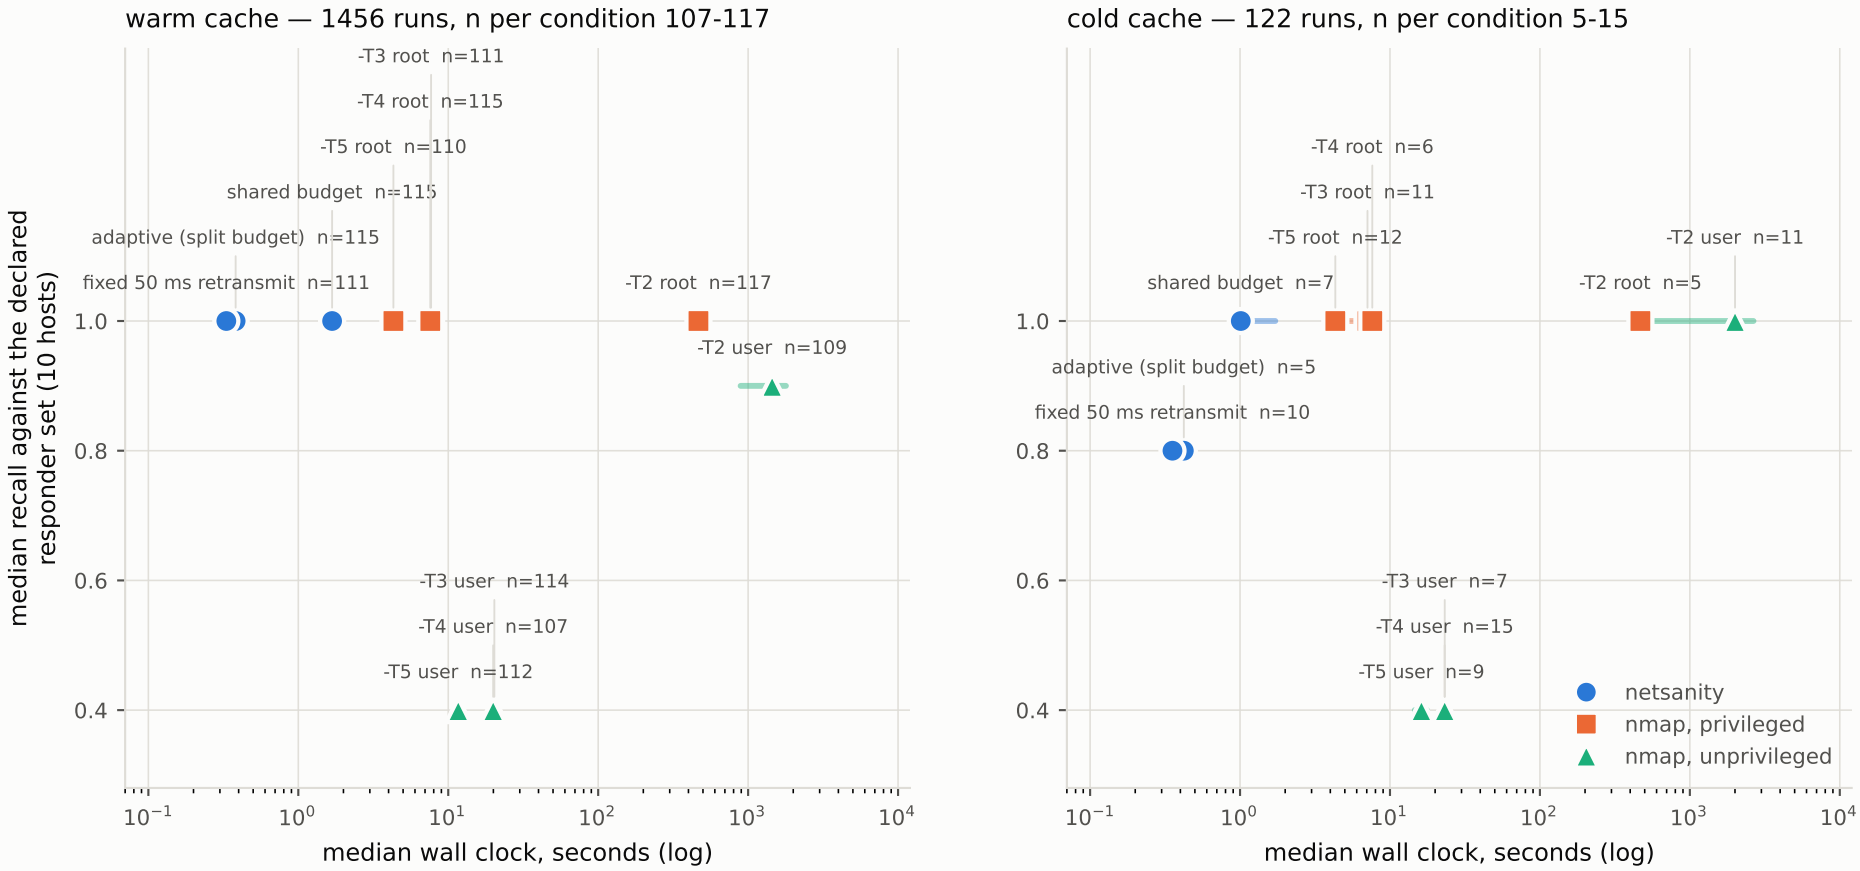
Figure 1 — speed against completeness, measured



Point: median wall clock and median per-run recall. Bar: bootstrap 95% interval on the median time, 10,000 resamples. Grey step: nmap's own frontier. Up and to the left dominates. Study/data/runs.ndjson, 1,580 runs, 120 complete blocks; the two excluded runs are dropped and the partial blocks' admissible runs are kept, as the protocol's exclusion rules have it.
